tagged normalized libraries was mixed in the proportions specified above and electroporated into competent bacteria for production of single-stranded circular DNA representing the pool of libraries. Single-stranded circular DNA representing these five normalized libraries was then used as a tracer in a subtractive hybridization with a driver (PCR amplified inserts from a plasmid DNA template preparation) comprising: a) a set of about 1,000 arrayed clones from each of the five non-normalized libraries of brain (CTOS), heart (CSOS), kidney (CUOS), aorta (CWOS), and placenta (CXOS). The resulting pool of approximately 5,000 clones represented about 33.38 of the final driver population. A set of about 2,000 arrayed clones from each of the five normalized libraries of brain (CTO), heart (CSO), kidney (CUO), aorta (CWO), and placenta (CXO). The resulting pool of placenta (CXO). The resulting pool of clones from each of the five normalized libraries of brain (CTO), heart (CSO), kidney (CUO), aorta (CWO), and placenta (CXO). The resulting pool of about 10,000 clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              adult day 1, adult day 12, adult day 75, and adult day 200. (Exception: the aorta pool does not contain embryonic day 17 RNA and the placenta pool contains only the three embryonic stages). Each library was normalized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RNA from seven different developmental time points: embryonic day 17, embryonic day 19, embryonic day 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              individually according to the procedure described by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      791-806, 1996). For construction of the DKU subtracted library, plasmid DNA from each of the five individually
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      library was constructed from a mixture of equal amounts of

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8 x 6666666 x 8
                                                                                           This sequence represents a primer for a fragment of HCV, and is an example of an oligonucleotide of the invention. The oligonucleotides of the invention are of the formula 5'-S1-Nu-3' or 5'-S1-Nu-S2-3', where nucleotides; and Nu is a nucleotides; S2 is a sequence of 1-3 nucleotide with a purime or pyrimidine base having an exocyclic amino group substituted by CHRIR2; R1, R2 are H, substituted naphthyl. The oligonucleotides are useful as primers for
              nucleic acid amplification, preferably by polymerase chain reaction. Use of the modified primers reduces non-specific amplification, especially primer dimer formation, with a concomitant increase in the yield of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                  The specification describes a composition of magnetic glass particles, which contain at least one magnetic object with a mean diameter between 5-500 nm. The composition is useful for the purification of nucleic acids. The composition can be used to process large quantities of nucleic acid samples, because it does not involve the particles being centrifuged or the fluids being drawn through glass fiber filters. PCR primers AAH25413-14 were used to amplify HCV DNA fragments. The amplified fragment can be purified using the method of the invention.

It is capable of detecting the tuberculosis bacterial group including Mycobacterium tuberculosis, Mycobacterium bovis BCG, Mycobacterium africanum, Mycobacterium microti and/or Mycobacterium canotti. The method is useful in disease diagnosis and monitoring therapy. This polynucleotide sequence represents a probe

The invention relates to a probe containing a 410 or 20 base pair sequence, given in the specification. It is capable of detecting the tuberculosis bacterial group including Mycobacterium tuberculosis, Mycobacterium bovis BCG, Mycobacterium africanum, Mycobacterium microti and/or Mycobacterium canotti. The method is useful in disease diagnosis and monitoring therapy. This polynucleotide sequence represents a PCR primer relating to the detection of pathogenic microorganisms of the

The present sequence represents Hepatitis C virus (HCV) 5'-UTR domain II RNA probe used in a RNA electrophoretic gel mobility shift assay (EMSA). The present sequence is described in an cinvention relating to a novel compound comprising nucleotide sequences crapable of annealing and which is derived from a 5'-untranslated crapable of entry of HCV which is essential for binding of eIF3 (eukaryotic cinitiation factor 3). The invention particularly relates to a cribosome entry site (mIRES) which can be used to identify drugs which contained the compounds of the invention may contain the mIRES enable potential HCV antiviral compounds. Assays based con the mIRES enable potential antivirals to be screened in a cheaper compound are suitable to parallel processing.

Sequence 155 BP;
                       virucide, hepatotropic and anti-inflammatory activity, and are useful treating HCV infection by inhibiting translation of type I-V HCV RNA. Hepatitis C virus is a positive strand RNA virus, and is the major causative agent of post-transfusion hepatitis. Persistent HCV infection lead to chronic hepatitis, cirrhosis, and hepatocellular carcinome
                                                                                                 This sequence is an uncountry physiological conditions. The Hepatitis C virus (HCV) RNA, under physiological conditions. The invention relates to HCV antisense oligonucleotides, and also for a vector comprising a nucleotide sequence which is transcribed in an animal cell to generate an antisense oligonucleotide. The oligonucleotides have

infection

encoding HCV epitope(s) - fection via polymerase chain

for diagnosis n reaction

The nucleotide sequences represented in AAQ14076-86 and AAQ14767-71 encode epitopes from structural, non-structural and 5' untranslated domains of hepatitis C virus. The sequences are used for accurate and simple diagnosis and typing of HCV infection, using PCR

                                               region a pair of oligonucleotioes was well as primers for HCV PCR. HCV RNA was isolated from HC-JI were used as primers for HCV PCR. HCV RNA was isolated from serum of a putatively infected individual. RNA reverse transcription PCR was performed and a specific PCR prod. identified. The prod. was used to transform E. coli DH5 alpha to obtain pGHCVIA contg. a 342 bp insertion from the HCV 5' non-coding region. This probe is highly specific and sensitive for HCV RNA. The probe can be shighly specific and sensitive for HCV RNA. The probe can be shighly specific and sensitive for HCV RNA. The probe can be shighly specific and sensitive for HCV IN samples, to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The nucleotide sequences represented in AAQ14076-86 and AAQ14767-71 encode epitopes from structural, non-structural and 5' untranslated domains of hepatitis C virus. The sequences are used for accurate and simple diagnosis and typing of HCV infection, using PCR amplification techniques:

                                                                                                             I probe complementary to at least 1 single stranded region; and (11) at least 1 probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe /folded target complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles of mammalian manes associated with discourse research to the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles
                                                                                                                                                                                                                                                   The invention relates to methods and compositions of detection and characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a folded target having a DNA sequence comprising at least 1 double stranded region and at least 1 single stranded region; and (ii) at least
                                                                                                                                                                                                                                                                                                                                                                                    Detection and characterisation of nucleic acid sequences - by a folded target and one or more probes to form a probe/folded complex and detecting and characterising the complexes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            03-MAR-1998;

of mammalian genes associated with disease and cancers, and the identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing. The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer

                                                                                                                                                                                                                                                                                                                                                                                                                                  performed in solution or in the solid phase (e.g. on a solid suppor
The methods are powerful in that they allow for analysis of longer
fragments of nucleic acid than current methodologies. Sequences
AAV/0449-52 represent a hepatitis C virus (HCV) subtype sequences
produced by PCR. These PCR products can be used in hybridisation an
using multiple capture probes for HCV genotyping.

probe /folded target complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic acids targets; and for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a folded target having a DNA sequence comprising at least 1 double stranded region and at least 1 single stranded region; and (ii) at least 1 probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a identification of the source of nucleic acids found in forensic samples as well as in paternity determinations. The methods allow simultaneous analysis of both strands (e.g. the sense and antisense strands) and are as well as of mammalian genes associated with disease and cancers, The invention relates to methods and compositions of detection and the and
